Let's talk about STIs
What is an STI?

An STI – or sexually transmitted infection – is an infection that’s spread through unprotected sexual contact. If you have unprotected vaginal, anal or oral sex (without a condom) you could get or pass on an STI. Common STIs include HIV, chlamydia, herpes, syphilis, gonorrhoea and genital warts.

Anyone can get an STI, even if you’ve only had sex once. You don’t need to have had lots of partners to get an STI.

How do I know if I have an STI?

It’s good to know the signs of the most common STIs. If you notice any of these symptoms (signs), go to a health facility as soon as possible, get tested and get treated:

▲ unusual discharge (which could be smelly, itchy, yellow or green) from the vagina or penis
▲ pain or burning when you pass urine
▲ needing to pass urine often
▲ pain in your lower belly
▲ sores, blisters, warts, lumps or a rash around the penis, vagina or anus
- itching, burning or pain in the genitals (your private parts)
- painful swelling of the vagina, testicles or penis
- pain during sex
- bleeding during or after sex
- bleeding between periods
- in women, fever, with any of these symptoms, especially pain in the lower belly, is very serious.

You can’t tell just from looking at somebody that they have an STI because some STIs, like chlamydia, don’t have any symptoms. So you – or your partner – could have an STI without knowing it. That’s why you should get tested regularly if you have sex without a condom.

**HOW CAN I PREVENT STIs?**

✔ **Use a condom correctly every time you have sex.** This lowers your risk of catching or passing on an STI. But if your partner has sores, a rash or blisters on their genitals that aren’t totally covered by a condom, you won’t be protected. See the leaflet ‘Let’s use a condom’.
Go for regular check-ups. Even if you’ve been going out with your boyfriend or girlfriend for a long time, you should still get tested, just to be safe.

Don’t rely on herbs. They won’t cure STIs. And if you are living with HIV, they could stop your treatment from working.

Why should I get tested?

If you don’t get tested, and you don’t get treatment as soon as possible, STIs could seriously harm your health and be very painful. Some untreated STIs could mean that you won’t be able to have children in the future. And if you have an STI, your risk of getting HIV is higher.

See the leaflet ‘Let’s use a condom’.
The good news is that most STIs are easily treated. Some STIs, such as herpes, HIV or genital warts, can’t be cured but the symptoms can get better. If you test positive for HIV, correctly using HIV treatment means you can still lead a long, healthy life.

**where should I go for treatment?**

You might feel nervous about getting tested. But there’s no need to feel shy. You can go to the nearest health facility for testing, where you have the right to respectful and confidential treatment.

My nearest health facility for STI testing is …
If you have a regular sexual partner, you can bring them to the clinic too, as both of you may need treatment. If only you receive treatment, and you and your partner then have unprotected sex, you might get infected again. If you don’t have a regular partner, it’s a good idea to tell your recent sexual partners that they need to go to a health clinic for a check-up.

You are doing the right thing: taking care of your health and other people’s.
